

Environmental Analysis

CARLO ERBA

REAGENTS

CARLO ERBA Reagents, a recognized chemical supplier for more than 150 years, operates at an international level in Analytical and Industrial Chemistry in the laboratory and industry sectors.

With its two production units, the CARLO ERBA Reagents Group offers its customers quality and service through the flexibility of production and installations. Mixers up to 7000l, distillation columns, storage tanks, automated packaging lines, clean rooms are some of the technologies engineered to meet the vast range of the market needs.

Standard operational procedures highly qualified operators for better plant management, permanent controls all phases of production and packaging are the criteria that guide CARLO ERBA Reagents in its industrial activity.

SOLVENTS FOR UHPLC-MS

UHPLC-MS remains at the cutting edge of liquid chromatography and has become one of the most prevalent instrument in analytical labs that allows to work at very high pressure, with minimum solvent consumption and a guarantee of resolution and reproducibility of results.

CARLO ERBA Reagents has developed a specific range of solvents dedicated to UHPLC-MS in order to meet the quality requirements of this refined and demanding analytical technique.

- Purity greater than **99.95 %**
- High UV transmission
- Excellent baseline quality in gradient **tested specifically for UHPLC**
- Reserpine test (< 30 ppb) => specific test for MS application
- Low content in inorganic and metallic ions
- Non volatile residue less than 1 ppm
- Filtration at least 0.2µm or 0.1µm
- Packaged in 1.1-difluoroethane treated amber glass to significantly reduce the potential formation of metals adducts

SOLVENTS, ADDITIVES AND BLENDS FOR LC-MS

FOR your LC-MS routine analysis, CARLO ERBA Reagents offers a complete range of products the most common solvents, additives and solutions ready-to-use among the most used mobile phases :

- Time saving
- Precise composition
- The assurance of an LC-MS quality
- Traceability
- Repeatability

Produced from LC-MS quality solvents and specifically tested for LC-MS coupling, these solutions guarantee :

- Test in gradient mode
- High UV transmission
- Solvent purity > 99.95 %
- Precise additive content
- Low content in inorganic and metallic ions
- Packaged in 1.1-difluoroethane treated amber glass to significantly reduce the potential formation of metals adducts

ION CHROMATOGRAPHY / STANDARD SOLUTIONS

Our standard solutions for ion chromatography are obtained by a high-purity salt (+99.9%) in water.

They are characterized by :

- Concentrations equal to 1000 ppm
- Guaranteed titer with its uncertainty
- Raw materials selected and verified against N.I.S.T. Standard Reference Materials
- Available in HDPE bottles
- Certificate of analysis with references on the analytical method, the N.I.S.T. Standard Reference Materials and the confidence interval
- Shelf life, for the unopened product package, of 2 years.

ION CHROMATOGRAPHY / CONCENTRATED MOBILE PHASES

FOR your ion chromatography analysis, we have selected common mobile phases. The following eluents are filtered at 0.2µm and prepared from ultra-pure salts and 18-megaohm deionized water. These are concentrated solutions that should be diluted by a factor of 100.

They are characterized by :

- Guaranteed titer with its uncertainty
- Raw materials selected and verified against N.I.S.T. Standard Reference Materials
- Available in HDPE bottles
- Certificate of analysis with references on the analytical method, the N.I.S.T. Standard Reference Materials and the confidence interval
- Shelf life, for the unopened product package, of 2 years.

SOLVENTS GC-MS

THE recent technological advances of GC-MS, GC-MS/MS and 2D GC-MS have opened new analytical horizons, in terms of selectivity of the result, and allowed a reduction of detection limits, reducing the need for cleaning the sample and the introduction of faster methods for sample preparation.

The role and the choice of the quality of the solvent is consequently crucial for the production of a precise and accurate analytical data. That is why we are introducing a new product range dedicated to the most demanding need for GC-MS. These products were specifically tested for GC/MS test for individual signals, with a retention range of C_{11} to C_{40} with a scanning area of 30-600 amu with a guarantee of less than 2µg/l of impurities.

The CARLO ERBA Reagents GC-MS solvents guarantee excellent performance, even for the analysis of the most complex mixtures. They are characterized by :

- Very high purity
- Extremely low non volatile residue content
- Functionality tested in GC-MS

PESTIPUR®

FOR PESTICIDES RESIDUE ANALYSIS

THE CONTROL of pesticide residues in the food and environmental sectors is remarkably important today, as these substances represent a potential public health hazard. The purity of the solvent is a determinant factor in obtaining reliable results. Thus it is essential to have products available with suitable parameters for this type of application.

To meet these needs, CARLO ERBA Reagents offers its **PESTIPUR®** line of solvents, specific for the extraction of pesticides and the analysis of chlorinated and nitrogenous residues, even at trace levels. Our products are prepared according to the most advanced distillation techniques and strictly controlled in order to guarantee the highest level of quality.

Various functionality tests ensure a stable base line in gas chromatography. For the entire **PESTIPUR®** line, the absence of critical impurities is ensured by means of precise functionality tests in GC-ECD and GC-NPD .

ISO 17993:2002 specifies a method using high performance liquid chromatography (HPLC) with fluorescence detection for the determination of 15 selected PAHs in drinking and ground water in mass concentrations greater than 0,005 µg/l (for each single compound) and surface waters in mass concentrations above 0,01 µg/l.

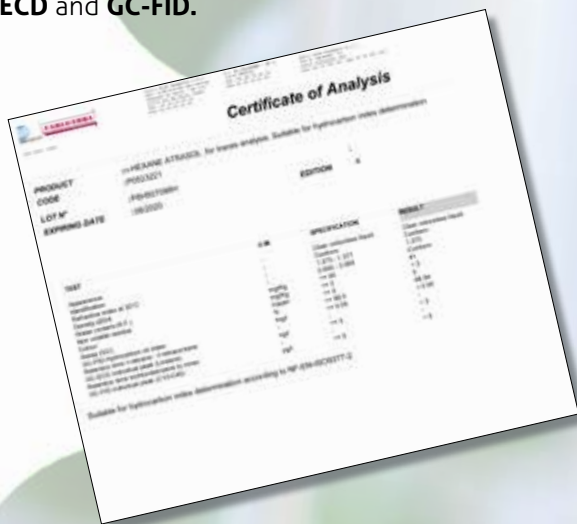

To avoid additional internal validation, CARLO ERBA Reagents tests the PAH content of Dichloromethane quality PESTIPUR® according to NF EN ISO 17993: 2002 and guarantees the minimum possible interference to use.

ATRASOL® SOLVENTS FOR THE DETECTION OF TRACES IN ORGANIC COMPOUNDS AND HYDROCARBONS

RIGOROUS gas chromatographic controls and extreme operation accuracy in both production and packaging make these the best-suited solvents in gas chromatography for all determinations of traces of organics requiring extreme precision and sensitivity.

High purity, guaranteed absence of extraneous peaks in gas chromatographic determinations and guarantee of reproducibility and repeatability of the results are the main feature of this product line.

For the entire **ATRASOL®** line, the absence of critical impurities is ensured by means of precise functionality tests in **GC-ECD** and **GC-FID**.

ATRASOL® SOLVENTS FOR HYDROCARBON INDEX DETERMINATION ACCORDING TO EN ISO 9377-2

THE EUROPEAN regulation EN ISO 9377-2 "Determination of hydrocarbon oil index - Method using solvent extraction and gas chromatography", established the criteria for the evaluation of the hydrocarbon index in water using gas chromatography. This procedure is suitable for surface water, wastewater and water from sewage treatment plants.

Isohexane, hexane and petroleum ether ATRASOL®, with their boiling range between 36 and 69°C, are ideal for this application. Each batch is specifically analyzed so that the hydrocarbon index is less than or equal to 0.1 mg/l, in the retention time window between n-decane and n-tetracontane.

ACIDS FOR TRACE METAL ANALYSIS

IN choosing the most appropriate analytical method to determine metals, each laboratory must consider the sample type and concentration levels, the number of elements to be determined and the costs the choice implies. As a result, flame and graphite furnace atomic absorption spectrophotometry (AA) and inductively coupled plasma (ICP and ICP-MS) emission spectrometry are the most widely used analytical methods for determining trace elements.

Instrumental analysis, using ICP or AA, generally involves a preliminary treatment of the sample. This operation, known as acid mineralization, consists in a digestion process with hot concentrated acid in order to extract the elements of interest. CARLO ERBA Reagents offers two specific complete range of products (acids, bases and water) for sample and blank preparation. The purity of these products guarantees maximum reliability of the result.

ENVIRONMENTAL
CONTAMINANTS:
TRACE METALS

SUPERPURE ACIDS FOR TRACE METAL ANALYSIS AT PPB LEVEL

SUPERPURE range is characterized by blank values generally between 0.5 and 1 ppb, for the 60-plus declared impurities. They are produced using the most advanced sub-boiling distillation techniques, in special equipment made of quartz or Teflon and packaged in a controlled environment. In order to minimize the possibility for contamination of the resultant distillate, the packaging is performed in a clean room. They are available in a wide variety of molecules and sizes.

Product	Pkg	Code
Acetic acid glacial	500 mL	401405

1 L		410406
2,5L		410407
Ammonia 20-22%	500 ml	420175

ULTRAPURE ACIDS FOR TRACE METAL ANALYSIS AT PPT LEVEL

ULTRAPURE range is characterized by blank values generally between 50 and 1 ppt, for the 60-plus declared impurities. This extreme level of purity is obtained using the double sub-boiling distillation process and preserved in Teflon packaging, preconditioned with hot acid for at least one week.

Product	Pkg	Code
Acetic acid glacial	500 mL	401361
Ammonia 20-22%	500 ml	420161

STANDARDS FOR ATOMIC ABSORPTION SPECTROSCOPY

THE ATOMIC absorption is the most sensitive technique available to analysts for the determination of metal impurities. It is a technique based on a sequential system which is generally slow but achieves sensitivity limits unattainable with other instrumental techniques. The following ready-to-use standard single-element solutions are obtained by dissolution of the metal, at a purity level of 99.9%, in hydrochloric or nitric acid.

They are characterized by :

- Concentration of the metal equal to 1.000 ppm
- Available in 100ml and 500ml bottles in polyethylene or glass depending on compatibility
- Certificate of analysis with references on the analytical method, the N.I.S.T. Standard Reference Materials and uncertainty
- Shelf life, for the unopened product package, of 2 years.

STANDARDS FOR ICP-OES

ICP-OES is a widely used analytical technique for trace metal analysis. It is based on a simultaneous system which allows quick and convenient analyses for a large number of determinable elements. One of the latest technological advances in the area is ICP-OES which is used for the determination of trace elements in soil. These standard solutions are obtained by dissolution of the metal, at a purity level of 99.99%, in an acid (usually nitric acid).

They are characterized by :

- Guaranteed titer with its uncertainty
- Raw materials selected and verified against N.I.S.T. Standard Reference Materials
- Available in 100ml and 500ml polyethylene bottles
- Certificate of analysis with references on the analytical method, the N.I.S.T. Standard Reference Materials the confidence interval
- Shelf life, for the unopened product package, of 3 years.

STANDARDS FOR ICP-MS

ONE of the latest technological advances in the area of coupled analytical techniques involves the optimization of the ICP-MS technique, a versatile and vital instrument for the quick and reliable analysis of trace and ultra-trace metals. These standard solutions are obtained by dissolution of the metal, at a purity level of 99.999%, in an acid (usually nitric acid).

They are characterized by :

- Guaranteed titer with its uncertainty

- Raw materials selected and verified against N.I.S.T. Standard Reference Materials and packaged in a cleanroom
- Available in 100ml LDPE bottles
- Certificate of analysis with references on the analytical method, the N.I.S.T. Standard Reference Materials the confidence interval
- Shelf life, for the unopened product package, of 2 years.

ORGANIC MIXTURES

CARLO ERBA Reagents offers the possibility to realize tailored formulations of organic substances (pesticides, IPA, PCB, nitrogenous substances, chlorinated, etc ...) produced according to an ISO 17025 accredited Quality Management System and ISO Guide 34.

Organic standard solutions are prepared according to your analytical needs for HPLC, GC and GC-MS. These solutions are custom-made standards which bring you lots of advantages :

- Time saving for preparing and controlling standard solutions
- Traceability to NIST
- Specific for instrument calibration
- No risk of precipitation mixing incompatible solutions : the best solution (two or more mixes or another solvent) is proposed if there's a problem of compatibility.
- Exact quantity needed (from 0.5 ml in ampules or CERTAN bottles to 500 ml)

Each of our products are delivered with a certificate of analysis including :

- Batch number
- Expiry date
- Storage information
- CAS number, formula, purity of each starting material
- Gravimetric data

ISO 9377-2 STANDARD SOLUTIONS

FOR the determination of mineral oils, the regulation prescribes specific mixtures of standard solutions. CARLO ERBA Reagents has a complete range of standard mixtures, each with a certificate of analysis with complete information on the composition and gravimetric validation carried out in reference to NIST standards.

Product	Pkg	Code
Standard quality control of 2 mineral oils in acetone 0.5mg/ml each	1 mL	506002
Mixture of 2 mineral oils without additive 5 mg / ml each in hexane	1 mL	506010
	5 mL	506012
	10 mL	506013
Mixture of 2 mineral oil without additive 1 mg/ml each in hexane	10 mL	506011
Standard mixture of n-alkanes (C ₁₀ to C ₄₀ in pairs) of 50 µg/ml each in hexane	1 mL	506020
Mother solution of extraction solvent : N-tetracontane mixture (20 mg/l) and n-decane (20 µg/l) in hexane	5 mL	506040
Test solution stearyl stearate 2 g / l in hexane	10 mL	506030

REAGENTS FOR COD ANALYSIS

THE COD (chemical oxygen demand) represents the measurement of oxygen necessary to chemically oxidize the substances present in a sample, by means of a strong oxidant in a hot acid environment.

The determination of this parameter, which represents the organic content in water, is an analytical factor commonly used in controlling the level of pollution in natural water as well as urban and industrial wastewater. CARLO ERBA Reagents offers a complete line of reagents for COD determination.

Product	Pkg	Code
Ferrous ammonium sulfate Reagent for titrating the excess potassium dichromate	500 g	451451
	1 kg	451457
Potassium dichromate Oxidizing reagent	500 g	470336
	1 kg	470337
Potassium hydrogen phthalate COD determination	250 g	471865
	2.5 kg	471867
Sulfuric acid concentration 96 % (d = 1.84)	1 l	410301
	2.5 l	410306
Silver sulfate Oxidizing reagent	25 g	424201
	100 g	424203

Ready-to-use solutions are also available to be used directly by analysts with significant time savings :

Product	Pkg	Code
Ferrous ammonium sulfate Solution 0.12 mol/l	1 l	526761
Iron o-Phenanthroline sulfate (Ferroun) Solution Indicator for titration in sulfuric acid	100 ml	E450043
Potassium dichromate Solution 0.25 N	1 l	470541
Potassium dichromate 0.04 mol/l ($K_2Cr_2O_7$) in solution of 80 g/L $HgSO_4$	1 l	526711
	2.5 l	526712
Silver sulfate Solution 0.7% Ag_2SO_4 in conc. sulfuric acid	1 l	424191
	2.5 l	424192
10 g/L Ag_2SO_4 in conc. sulfuric acid	1 l	526605
	2.5 l	526606
6.6 g/L Ag_2SO_4 in conc. sulfuric acid	2.5 l	526602

Find in our **Labware** catalogue the dedicated chapter to COD analysis with consumables and equipments for both manual and automatic titration

ACIDS & REAGENTS

LOW CONTENT OF MERCURY

DUE to its particular physico-chemical properties, as the only liquid metal at room temperature and an excellent conductor, mercury is widely used in the industrial sector.

However, the significant hazard it represents for the environment has led numerous government decrees to be issued imposing limits on the order of ppb depending on the type of water (underground water, surface water to be used as drinking water and water suitable for fish life). The analytical method used to determine mercury content is based on atomic absorption spectrophotometry at a wavelength of 253.7 nm.

The sample is mineralized with a mixture of sulfuric and nitric acids, and the mercury salts are subsequently reduced to metal with hydroxylamine, hydrochloride and stannous chloride in the presence of NaCl; the mercury content is then determined by means of atomic absorption spectrophotometry.

Product	Quantity of Hg	Pkg	Code
Nitric acid 65%	≤ 0.005 ppm	1 l	407951
Perchloric acid 65%	≤ 0.02 ppm	1 l	409121
Potassium permanganate	≤ 0.05 ppm	100 g	476671
Sodium chloride	≤ 0.005 ppm	100 g	479671
Sulfuric acid 96%	≤ 0.005 ppm	1 l	410261

Besides the obvious “green solvents”, water and ethanol, **CARLO ERBA Reagents** is happy to offer a variety of greener alternatives to several common solvents .

For more information on these solvents and what CARLO ERBA Reagents proposes in terms of “Green solutions” for Quality and Safety, download our dedicated brochure

Do you work safely?

asecos®

- Do you use dangerous chemicals ?
- Do you consider chemical incompatibilities for the storage of hazardous products?
- Do you know the legislation on the handling and storage of hazardous materials in effect on the workstation?
- Are your flammable substances stored in safety cabinets certified to NF-EN-14470-1?
- Do you apply these rules?

You do not have 5/5 to this questionnaire?
CARLO ERBA Reagents in partnership with **asecos®** has the solutions to assist you in the security of your workstation.
 Your sales manager is available to bring you his expertise.

FILTER AIDS

BESIDES the widely used silica gel, other products with particular characteristics are also available and offer a series of valid alternatives for resolving numerous separation problems.

CARLO ERBA Reagents proposes a wide range of silica gel among the general used types.

VOLUMETRIC SOLUTIONS / READY-TO-USE

To meet the requirements of users, both in the field of production control and in the area of research it is important to:

- Identify and control according to increasing demands
- Work according to Good Laboratory Practice
- Follow the general requirements for accreditation and certification of laboratories

CARLO ERBA Reagents offers a complete range for large consumption of ready-to-use volumetric solutions, with guaranteed quality.

- Exact title of the batch printed on the label and on the certificate of analysis
- Reference and traceability to S.R.M. of N.I.S.T.
- Assay precision: +/- 0.1%, where indicated
- Available in both polythene or glass bottles, with ISO 45 bottle mouths which are adaptable to automatic titrators
- Available in 5L and 10L Kubidos® packages supplied with tap and cap, ideal for excellent storage and dosing of the product.

Kubidos® consists of a cubic box with a HDPE container, a tap and cap ensuring easy flow of the required volume. With the low volume of product in contact with air, the risks of carbonation of alkaline solutions and microbial contamination are limited.

NORMEX / CONCENTRATED VOLUMETRIC SOLUTIONS

CARLO ERBA Reagents also offers a series of concentrated volumetric solutions packaged in convenient NORMEX vials. These are ideal for users who would like to prepare solutions immediately before the analysis in a rapid and precise manner. This brand comes in concentrated diluting ampoules, the preparation is effective into 1 liter of distilled water, rapidly transforming the vials contents into volumetric solution.

- 1 vial = 1 l of solution,
- To dilute with distilled water,
- Titration factor +/- 0,005 ,
- Economic and less bulky,
- Glass or plastic vial according to the molecule,
- Instructions for use on the box.

BUFFERS IN SOLUTION / READY-TO-USE

THESE solutions are traceable to N.I.S.T and precisely standardized at 20°C, which makes them ideal for solving calibration problems with other solutions and preventing errors due to various factors such as the kind of salt or water used.

To enable immediate identification of the buffer, colored solutions, traceable to N.I.S.T, are available.

INDICATORS FOR pHMETRY

INDICATORS represent a practical and important tool for monitoring the progress of a reaction of an aqueous solution, operations which are often essential for obtaining correct analytical data. The direct method, i.e., placing the indicator in the solution being analyzed, is the most efficient and thus the most widely adopted method for acid-base titration. Since the indicator competes with the species being titrated, its use in significant quantities may alter the result of the titration; therefore it is critically important to choose the most appropriate indicator for the type of analysis being performed.

For the determination of pH values in aqueous solutions, universal indicators in solution are available for measurements in a variety of pH ranges. These products are supplied complete with a color scale and detailed instructions for use. The sensitivity of these solutions is higher than that of pH indicator papers.

Product	Pkg	Code
Alizarin saturated solution in ethanol	250 ml	E415932

INDICATORS FOR UV-FLUORESCENCE, REDOX, PRECIPITATION AND COMPLEXOMETRY

■ **UV Fluorescence indicators** : The use of chromatic indicators may not be equally effective with turbid or colored solutions, or when the change in concentration is not fast enough. In these cases, instrumental methods or fluorescence indicators may be adopted to identify the end point.

■ **Oxidation-reduction indicators**: These indicators are substances that vary in color depending on whether they are in oxidized or reduced form. Their behavior is very similar to that of the indicators used in acid-base titration; however, while the latter are sensitive to changes in the solution's pH, oxidation-reduction indicators are sensitive to changes in the system's potential. The color changes are usually very clear and well-defined.

■ **Precipitation indicators** : Precipitation titration methods have very limited applications compared to other types of volumetric analysis, but the few that are still employed are very useful in practical terms. The titration process is based on the formation of an insoluble compound between the titrating agent and the substance being titrated, which gradually results from the reaction that occurs during titration. Precipitation indicators allow visual identification of the end point of titration thanks to a change in color, which corresponds to the variation of a key characteristic, such as a change in the precipitate's electric charge (isoelectric point).

■ **Complexometry indicators** : These are organic colorings, mainly of the azo group, which form stable complexes with metals and are characterized by different colors depending on whether they are in free form or complex form in the solution.

ERBAqua® REAGENTS FOR KARL FISCHER METHOD

ERBAQUA® is the new CARLO ERBA Reagents brand, for its complete range of pyridine-free reagents for the volumetric and coulometric Karl Fischer determination of water.

The main features of this range are: safer to use fast and stable endpoints and long term titre stability.

ONE COMPONENT VOLUMETRIC REAGENTS

IN ONE-COMPONENT volumetric Karl Fischer Titration, the titrant contains all the reagents required by the reaction: iodine, sulfur dioxide, base and an alcohol.

Available in two different titer strengths, 5 mg/ml and 2 mg/ml, they are suitable for routine analysis, and thanks to their methanol-free formulation, they can be used also if the sample contains aldehydes and ketones.

Product	Pkg	Code
Karl Fischer reagent 1 component 5 mg H ₂ O/ml	1 l	570011
Karl Fischer reagent 1 component 2 mg H ₂ O/ml	1 l	570021
Karl Fischer reagent 1 component 5 mg H ₂ O/ml for aldehydes and ketones	1 l	570081

We also provide specific working media to dissolve the sample :

Product	Pkg	Code
Methanol, Minimum purity 99.9% water <0.005%	1 l	414981
Chloroform, Stabilized with ethanol water <0.005%	1 l	P02410E16
Karl Fischer solvent for aldehydes and ketones	1 l	570091
Karl Fischer solvent for the titration of oils and non polar samples	1 l	570031
Karl Fischer solvent for aldehydes and ketones and high molecular weight substances and non polar	1 l	570041

TWO COMPONENTS VOLUMETRIC REAGENTS

FOR users who do frequent Karl Fischer analysis and need a higher degree of accuracy than one-component volumetric titration can provide, we recommend the two components range.

They give more accuracy in the results and have longer shelf life because the reagents required by the Karl Fischer reaction are separated between the titrant (iodine) and the working medium (sulfur dioxide and base). For general purposes, we offer two different titer strengths, 5 mg/ml and 2 mg/ml.

Product	Pkg	Code
Karl Fischer titrant 2 component 5 mg H ₂ O/ml - non hygroscopic	1 l	570051
Karl Fischer titrant 2 component 2 mg H ₂ O/ml - non hygroscopic	1 l	570061

In order to avoid side reactions in presence of aldehydes and ketones in the sample, we recommend to perform the analysis using the dedicated formulations : **570081** as titrant **to be used with 570091** as working medium. For oils or other non-polar compounds, **570101** is the suitable working medium. In case of need for an extra buffering capacity of 5 mmol of acid/ml, **570121** is the suitable working medium.

Product	Pkg	Code
Karl Fischer buffer solution	500 ml	570111
Karl Fischer solvent 2 component	1 l	570071
Karl Fischer solvent for oils one component	1 l	570031
Karl Fischer solvent 2 component for aldehydes and ketones - Methanol free	1 l	570091
Karl Fischer solvent for oils 2 component	1 l	570101

ERBAqua® REAGENTS FOR KARL FISCHER METHOD

WATER STANDARDS

STANDARDIZATION of a Karl Fischer reagent is necessary in order to determine its water equivalency. The ERBAqua® range includes both volumetric and gravimetric reference materials suitable for this kind of application.
